LoRaWAN in a Nutshell

Low-Power Wide-Area Network

Infrastructure

Version History

LoRaWAN in a Nutshell

Application Characteristics

deploy & forget sensors

long range, sparse infrastructure

battery-powered devices

best-effort delivery as default

LoRaWAN Security Risks for LoRaWAN

OTA updates are hard

sparse infrastructure facilitates jamming

power budget as enabler for DoS

differentiating attacks from loss of connectivity

LoRaWAN Security Selected Attacks on LoRaWAN

Integrity & Authenticity

- Bit-flipping between network and application server
- Beacon Spoofing
- ACK Spoofing
- Data replay after keystream reuse (ABP)

Confidentiality

 Frame decryption after key reuse (ABP)

Availability (DoS)

- Downlink Routing
- Beacon Drifting
- ADR Spoofing
- GW Duty Cycle Exhaustion

Physical Attacks

- Key extraction
- Device impersonation
- Gateway impersonation

LoRaWAN Security Focus: Attacks Over-the-Air

emergenCITY

ChirpOTLE Framework Requirements and Design Decisions

- easiest to access
- fewest assumptions regarding attacker capabilities

- **reproducibility** of results
- show that attacks are affordable

- Large network size must be taken care of
- Internet (IP network) for coordination

ChirpOTLE Framework

Framework Architecture

ChirpOTLE Framework

Interfaces, Control, Deployment

ChirpOTLE Framework Companion Application

ChirpOTLE Framework

Interaction with Nodes

ChirpOTLE Framework Preconfigured Boards

- TCP via WiFi
- Deployment still needs UART
- Limited performance (RIOT process not running in real-time)

Attacking the Wireless Interface LoRa PHY & Transceivers

LoRaWAN logo: lora-alliance.org

Attacking the Wireless Interface

Jamming (and Sniffing) LoRa

Sniffer close to transmitter

- Less interference by jammer
- Stonger signal from source

Jammer close to receiver

- Stronger jamming signal
- Creates less interference
 at sniffer

Attacking the Wireless Interface

Jamming Performance: Triggered Jamming

Attacking the Wireless Interface Reactive Jamming

Attacking the Wireless Interface Jamming Performance: Reactive Jamming

Jamming by Message Type

Using the Framework
Installing ChirpOTLE

ChirpOTLE comes with a **central shell script** for installation and management.

Toolchains (e.g. xtensa or gcc-arm-noneeabi) for platforms are **installed in local folders** and added to the path ad-hoc when related boards are used.

Relying on the distributor (Debian, Ubuntu, ...) often led to version incompatibilities.

\$ git clone \

- git@github.com:seemoo-lab/chirpotle.git
- \$ cd chirpotle
- \$./chirpotle.sh install

Using the Framework Device Placement & Node Configuration

The confeditor command helps managing the connected nodes.

./chirpotle.sh confeditor
======== Main Menu ==========
hat do you want to do?
List/edit controller configurations
List/edit node profiles
Save changes and quit
== Controller Configurations ===
Configuration: default
Create new configuration
Go back

Using the Framework Device Placement & Node Configuration

Using the Framework Preparing the Boards

deploy builds the firmware on the controller, sends it to the nodes and they upload it to the boards.

./chirpotle.	sh deploy	check
Running Custom	Node Scr	ipt

A Practical Example Delaying Traffic

tc, devices = tpy_from_context()

```
# Node at transmitter
alice = tc.nodes['alice']['lopy']
```

```
# Node at receiver
bob = tc.nodes['bob']['lopy']
```

Channel config

```
channel = {
  'frequency': 868100000, # Hz
  'bandwidth': 250, # kHz
  'spreadingfactor': 7,
  'syncword': 18, # private network
  'codingrate': 5,
  'invertiqtx': True,
  'invertiqtx': False,
  'explicitheader': True
```

```
# Initialize boards
```

```
alice.set_lora_channel(**channel)
bob.set_lora_channel(**channel)
```

Sniff and jam frames for device with DevAddr = DEADBEEF alice.receive() bob.enable_sniffer(action='internal', # use jammer on board pattern = [0, 0xDE, 0xAD, 0xBE, 0xEF], mask = [0, 0xff, 0xff, 0xff, 0xff))

```
# Wait for frame to be sniffed
frm = alice.fetch_frame()
while frm is None:
    frm = alice.fetch_frame()
    if frm is not None and \
        frm['payload'][1:5] != [0xDE, 0xAD, 0xBE, 0xEF]:
        frm = None
```

```
# Now we have a frame and set a delay
# (Bob continues jamming until standby() is called for him)
alice.standby()
time.sleep(120)
```

Now we disable the jammer and play the delayed frame bob.standby() alice.transmit_frame(frm['payload'], blocking=True)

Limitations & Next Steps

- **Control channel** via ubjson an stream processing is complex
 - Could maybe make use of **riotctrl**
- Only SX127x transceivers supported → single channel
 - Add support for SX1301 (LoRa concentrator)
- Build system and remote flashing needs much manual work (e.g., installing esptool, building bossa, the actual flashing on the nodes)
 - Still looking for a good solution
 → any input appreciated

About us

The LOEWE center emergenCITY, established in **2020**, combines the extensive research in Hesse on resilient and crisis-proof infrastructures in digital cities.

emergenCITY is an interdisciplinary and multi-site collaboration led by **Technische Universität Darmstadt**, **Universität Kassel, and Philipps-Universität Marburg**. Twenty-three professors from the fields of computer science, electrical engineering and information technology, mechanical engineering, social sciences and history, architecture, economics, and law conduct research in four interlinked program areas: City and Society, Information, Communication, and Cyber-Physical Systems.

Also, the **Federal Office of Civil Protection and Disaster Assistance (BBK), the City of Darmstadt, the German Aerospace Center (DLR)**, and more than 40 other partners from industry and science are involved in the center.
